

Baltimore City Seasonal Influenza Surveillance Report:

Week 1 - Week ending January 5, 2008

This week's level: **Flu Alert**

- 14% of "rapid" influenza tests reported by Baltimore City sentinel laboratories this week were positive
- 8% of visits reported by Baltimore City Sentinel Providers were due to Influenza-Like-Illness
- For information on preventing the flu (including vaccination), visit the Health Department website at www.baltimorehealth.org/flu or call 311

SUMMARY

Syndromic surveillance:¹ 8.3% of visits reported by sentinel healthcare providers² this week in Baltimore City were due to influenza-like-illness (ILI).³ The text of one 911 call during this time period contained a complaint of “flu-like illness.”

Documented influenza: The percentage of positive "rapid" influenza tests reported by Baltimore City sentinel laboratories⁴ was 13.8%, an increase from week 52 when the percent positive was 7.9%. There were no deaths due to influenza⁵ and the number of deaths due to pneumonia and influenza were consistent with this same time period in past years.

SYNDROMIC SURVEILLANCE

911 Call Data

There were four mentions of “fever” and one mention of “flu-like illness” in the text of 911 calls⁶ during this period. Numbers of daily calls for breathing problems and “sick” complaints are graphed below. The number of calls with the complaint of “sick” or “breathing problems” was consistent with this time period in previous years.

Emergency Department Data

During the past week, the number of patients presenting with chief complaints⁷ of fever or flu-like symptoms was consistent with this time period in previous years.

ILI Cases at Doctor's Offices

Table 1: Proportion of patient visits due to ILI from sentinel providers in Baltimore City and the Baltimore Metro Region

Week	No. of Reporting Sentinel Providers (Total)	Cases of ILI	Patients seen by reporting providers	% of patient visits due to ILI
Baltimore City				
1	2 (3)	93	1121	8.3%
Baltimore Metro Region⁸				
1	5 (13)	101	1396	7.2%

DOCUMENTED INFLUENZA

Lab Confirmed Cases of Influenza

The Maryland State Department of Health and Mental Hygiene laboratory reported the first PCR-confirmed case of influenza in a Baltimore City

resident on December 6. CDC reported to DHMH that the strain of this isolate was A/Solomon Islands/3/2006-like, which is a match to one of the three components of this season's influenza vaccine.

Rapid Test Confirmed Cases of Influenza

Table 2: Percent of positive rapid flu tests from Baltimore City and the Baltimore Metro Region sentinel hospital laboratories

Week	No. of Reporting Labs (Total)	No. of Positive Tests	Total Tests Performed by Reporting Labs	% Positive for Flu
Baltimore City				
1	2 (3)	11	80	13.8%
Baltimore Metro Region				
1	2 (7)	11	80	13.8%

Institutional Outbreaks

No institutional outbreaks of influenza have been reported to the Baltimore City Health Department during this period.

Influenza and Pneumonia Mortality

There were no deaths due to influenza and 15 deaths due to pneumonia. This constituted 9.7% of all deaths reported in Baltimore City during this week, similar to the same time period during the years 2003-2007 when P&I mortality ranged from 6.3-12.9%.

HOSPITAL CAPACITY DATA

There were no aberrations in the frequency of yellow or red alerts⁹ in Baltimore City hospitals during this period.

NOTES

¹The main goal of syndromic surveillance is to identify illness clusters early, before diagnoses are confirmed and reported to public health agencies. Non-specific indicators of illness such as chief complaint data from emergency departments will provide early indications that flu activity in the community may be increasing.

²The Maryland Department of Health and Mental Hygiene (DHMH) collects data from sentinel providers throughout the state as part of the Centers for Disease Control and Prevention's (CDC) national influenza surveillance program. The percent of patient visits due to influenza-like illness (ILI) is calculated as the total number of patients with ILI seen at all sentinel providers' offices divided by the total number of patients seen at these practices. Not all sentinel providers report each week; the number reporting each week this period

is documented in Table 1. Additionally, the number of providers reporting in the city is small and could result in fluctuations in the % of patient visits due to ILI.

³Influenza-Like Illness (ILI) is defined as a fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat in the absence of a KNOWN cause other than influenza. (<http://www.cdc.gov/flu/weekly/pdf/flu-surveillance-overview.pdf> - Last Accessed October 16th, 2007).

⁴Data on the percent of positive rapid-flu tests are reported to the Health Department by DHMH on a weekly basis.

⁵The Baltimore City Health Department reports mortality due to influenza and pneumonia to the CDC on a weekly basis. Deaths for which pneumonia or influenza was listed as the underlying or contributing cause of death are counted in this report. These numbers represent deaths that occurred in Baltimore City (regardless of residence of the deceased). The date of death is usually within ~2-3 weeks of the report.

⁶The Biosurveillance Analyst at the Baltimore City Health Department receives 911 call data on a daily basis and analyzes these data for aberrations in the number of calls in which "breathing problems," "sick," "fever," or "flu" are included in the text.

⁷Five Baltimore City emergency departments report chief complaint data to the Health Department's Biosurveillance Analyst regularly. Based on historical data, the data are analyzed for aberrations in chief complaints of fever or flu-like syndromes.

⁸The Baltimore Metropolitan Region includes Anne Arundel, Baltimore, Carroll, Harford, and Howard Counties, and Baltimore City.

⁹A hospital is on yellow alert when there are no available beds and ambulances are re-routed to a different hospital. Red alerts occur when the hospital has no available beds with EKG monitors and ambulances must be re-routed.
